Talk is cheap, show me the boob

Talk is cheap, show me the code

# mgj component-ios -C

```
Installing Objective-LevelDB (2.1.1004)
Installing OpenSSL-Universal (1.0.1.l)
Installing PLCrashReporter (1.2.0)
Installing PublicProtocolDomain (0.2.0)
Installing SDWebImage (3.7.1003)
Installing SSKeychain (1.2.1003)
Installing SwipeView (1.3.1002)
Installing TMCache (1.2.1004)
Installing WTPipelineForOC (0.1.3)
Installing leveldb-library (1.18.1001)
Installing libwebp (0.4.1003)
Generating Pods project
Integrating client project
```

```
[!] Please close any current Xcode sessions and use `Foobar.xcworkspace` for now.
```

```
Sending stats
```

```
Pod installation complete! There are 6 dependencies from the Podfile and 52
```

```
Setting the project indentation level to 4
```

```
Setting warnings at the project level
```

# mgj component-ios -c

The screenshot shows the Xcode interface with the file `AppDelegate.m` open. The left sidebar displays project structure with folders like Demo, Home, UISkeleton, Resources, UnitTests, and Frameworks, and files such as `AppDelegate.h`, `HomeViewController.h`, and `modules.plist`. The code editor shows the implementation of the `AppDelegate` class.

```
12 @implementation AppDelegate
13
14 - (BOOL)application:(UIApplication *)application didFinishLaunchingWithOptions:(NSDictionary *)launchOptions
15 {
16     [[ModuleManager sharedInstance] loadModuleFromPlist:[[NSBundle mainBundle] pathForResource:@"modules"
17         ofType:@"plist"]];
18     NSArray *modules = [[ModuleManager sharedInstance] allModules];
19     for (id<ModuleProtocol> module in modules) {
20         if ([module respondsToSelector:_cmd]) {
21             [module application:application didFinishLaunchingWithOptions:launchOptions];
22         }
23     }
24     return YES;
25 }
26
27 - (void)applicationDidBecomeActive:(UIApplication *)application
28 {
29     NSArray *modules = [[ModuleManager sharedInstance] allModules];
30     for (id<ModuleProtocol> module in modules) {
31         if ([module respondsToSelector:_cmd]) {
32             [module applicationDidBecomeActive:application];
33         }
34 }
```

Two sections of the code are highlighted with red boxes:

- The first highlighted section is located between lines 16 and 23, where the code loads a module from a plist and iterates through all modules to call their `didFinishLaunchingWithOptions:` method.
- The second highlighted section is located between lines 29 and 34, where the code iterates through all modules to call their `applicationDidBecomeActive:` method.

# mgj component-ios -c

```
#import "HomeModule.h"
#import <ModuleManager/ModuleManager.h>

#import "HomeViewController.h"
#import "HomeModuleProtocol.h"

@interface HomeModule () <ModuleProtocol>

@end

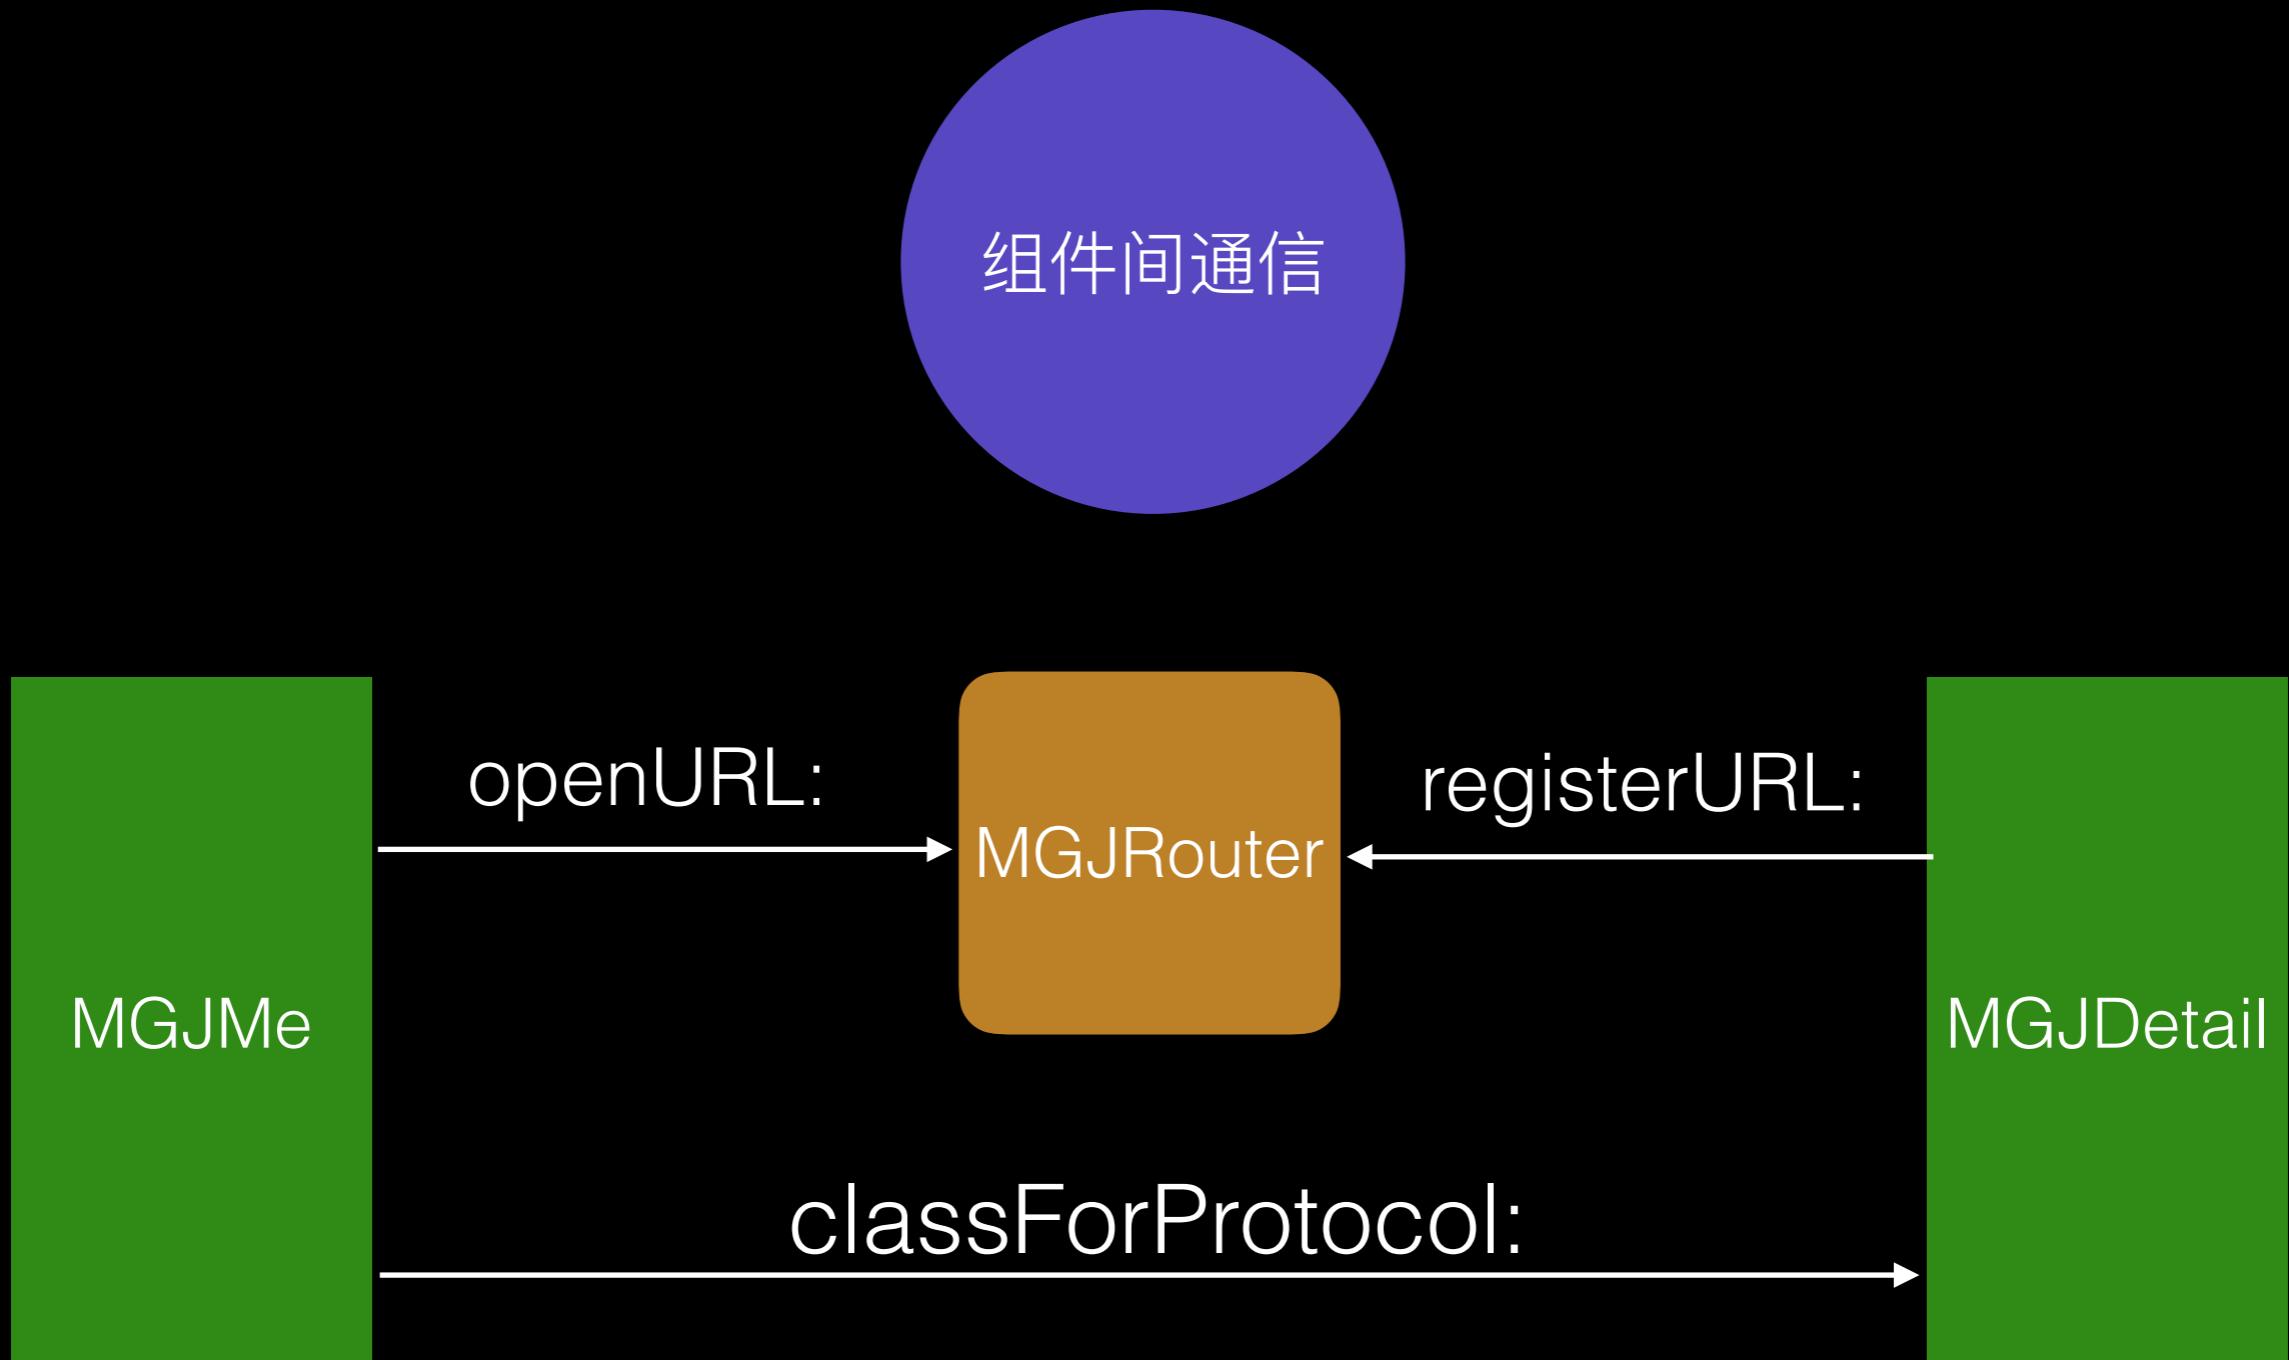

@implementation HomeModule

- (void)moduleOnInit
{
    [[ModuleManager sharedInstance] registerClass:[HomeViewController class] forProtocol:@protocol
    (HomeModuleProtocol)];
}

```

MGJModuleManager

[README](#) [CHANGELOG](#) [API](#)

MGJRouter

简介

MM 是一套模块管理框架，托管整个app的运行环境，对于模块化组织的项目而言，MM 是一个利器。另外，MM 约定了一种模块间通信的方案，解决了模块间依赖的问题，赋予了模块跨 App 的能力。

MGJImage

原理和实例

生命周期管理

MM 定义了一套模块协议 `@protocol ModuleProtocol`:

`@protocol ModuleProtocol <UIApplicationDelegate>`

`/*!`

`@brief 初始化时要做的事情:`

`a). 注册协议的实现类`

`b). 注册通知`

`c). ...`

`@discussion 只处理模块元信息，不涉及模块内部业务逻辑。`

`*/`
