

# Chapter 7.1

## Hough Transforms

*Image Processing and Computer Vision*

**LE Thanh Sach**

*Faculty of Computer Science and Engineering  
Ho Chi Minh University of Technology, VNU-HCM*

What is it?

**Analytic Shape**

- Principle
- Straight Lines
- Circles
- General Curves

**Non-Analytic  
Shape**

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

# Overview

## ① What is it?

## ② Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

## ③ Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

### What is it?

#### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

#### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

# What is it?

**Hough transforms** is a method for locating objects in input images.

## Questions

**Q1:** How do we specify objects being located?

**Q2:** Which information in the input image does Hough Transforms need?

## What is it?

### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

## Q1: How do we specify objects being located?

The objects can be expressed by one of the followings.

- 1 **Analytic Form:** The objects are represented by mathematical relations, for examples,

$$\text{Straight line: } y = ax + b$$

$$\text{Circle: } (x - a)^2 + (y - b)^2 = r^2$$

$$\text{Ellipse: } \left(\frac{x - x_c}{a}\right)^2 + \left(\frac{y - y_c}{b}\right)^2 = 1$$

$$\text{General form: } f(\mathbf{x}, \mathbf{a}) = 0$$

- $\mathbf{x}, \mathbf{a}$  : vector of variables and parameters respectively.

### What is it?

#### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

#### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

## What is it?

- ② **Non-Analytic Form:** The objects are represented by the location and the gradient of pixels on the objects' boundary.

**Figure 1:** A shape represented by its boundary and gradients

## What is it?

### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

## Q2: Which information in the input image does Hough Transforms need?

Hough Transforms needs:

- 1 Edge pixels (location information)
- 2 Gradient of edge pixels (directional information)

⇒ First-order derivatives can be applied to obtain the required information.

### What is it?

#### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

#### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

## What is it?

A simple method for obtaining the required information from the input image:

### Example

- 1 Differentiate input image  $I(x, y)$  to obtain gradient image  $I_g(x, y)$ .
- 2 Find a threshold  $T$ , e.g.,  $T = \text{percentile } 90\%$  of  $|I_g(x, y)|$
- 3 Obtain edge map:  $I_e(x, y) = |I_g(x, y)| > T$

### What is it?

#### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

#### Non-Analytic Shape

- A Special Case
- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

# Analytic Shape - Principle

Equation of straight lines:

**Image Space:** Treating  $a$  and  $b$  as constant parameters,  $x$  and  $y$  as variables

$$y = ax + b$$

**Parameter Space:** Treating  $x$  and  $y$  as constant parameters,  $a$  and  $b$  as variables

$$b = -xa + y$$

What is it?

Analytic Shape

Principle

Straight Lines

Circles

General Curves

Non-Analytic  
Shape

A Special Case

Generalized Hough  
Transforms (GHT)

GHT with Scaling and  
Rotation

## Analytic Shape - Principle

**Figure 2:** Left: **Image space**; Right: **Parameter space**

- **A point** in image space is **corresponding** to **a line** in parameter space.
- **A line** in image space is **corresponding** to **a point** in parameter space.

What is it?

Analytic Shape

Principle

Straight Lines

Circles

General Curves

Non-Analytic Shape

A Special Case

Generalized Hough Transforms (GHT)

GHT with Scaling and Rotation

## Analytic Shape - Principle

If we have  $N$  edge points on the line passing two points, called  $(x_i, y_i)$  and  $(x_j, y_j)$  (see Fig. 2), then :

- We have  $N$  lines in parameter space
- These  $N$  lines intersect at **a common point**:  $(a', b')$  in parameter space

⇒ Detect this **common point** in parameter space ⇒  
equation of line in image space:  $y = a'x + b'$

Transforms (GHT)

GHT with Scaling and  
Rotation

So, the basic idea is:

- ① **Discretize** parameter space into small cells. Each cell contains the number of lines passing it
  - The whole space now called the **Accumulator**  $A(i, j)$
  - $i = 0, 1, \dots, M - 1; j = 0, 1, \dots, N - 1$
- ② Find the common intersection point by finding the cell that contains the **largest number of lines** passing it. Assume that it is  $(a', b')$

The equation found is:  $y = a'x + b'$

## Challenging Problems

- ① **Accuracy:** The accurate estimation of parameter  $a$  and  $b$  depends on the resolution of the accumulator, i.e., the size of cells in the accumulator
  - $\Rightarrow$  Discretize parameter space into smaller cells.
- ② **Memory cost:** The accumulator contains so many cells, especially, in the case that there are **many parameters** and that we use a **high resolution** accumulator.
- ③ **Large or unlimited range:** In some cases, parameters have large ranges, for example,  $a$  in  $y = ax + b$

## Advantages of the expression with $(\theta, \rho)$

Range of  $\theta$  and  $\rho$  is **limited**.

- $-\pi \leq \theta \leq \pi$
- $-D \leq \rho \leq D$

$D$ : The maximum distance between two corners in images. Image's size:  $R \times C$ , then

$$D = \sqrt{R^2 + C^2}$$

# Analytic Shape - Detection of Straight lines

**Figure 5:** Demonstration of the discretization into  $M \times N$  cells

## Questions

- After discretization, how does cell's indices  $(i, j)$  relate to parameter  $\theta$  and  $\rho$ ?

What is it?

Analytic Shape

Principle

Straight Lines

Circles

General Curves

Non-Analytic Shape

A Special Case

Generalized Hough Transforms (GHT)

GHT with Scaling and Rotation

## Along $\rho$ -direction:

- $D = \sqrt{R^2 + C^2}$
- $\rho_{min} = -D; \rho_{max} = D$ : Left and right bound of the range
- $L_\rho = 2D$  : range's width
- $M$  : number of rows along  $\rho$  axis
- $i = 0, 1, \dots, M - 1$  : the index of cells along  $\rho$  axis
- $\Rightarrow$  Quantization step along  $\rho$  axis:  $\Delta_\rho = L_\rho/M$

## Questions

- ③ How can we detect a straight line with Hough Transforms?

## Algorithm: An Informal representation

---

### Algorithm 1 Hough Line Detection - PART1

---

- 1: Create an accumulator, referred to as  $A$
  - 2: Set 0 for all cells in the accumulator
  - 3: **for all** edge point in  $I_e(x, y)$  **do**
  - 4:     **for all**  $j \in [0, N - 1]$  **do**  $\triangleright$  **iterate on each cell along  $\theta$ -direction**
  - 5:          $\theta = \text{dcm}_{idx2\theta}(j)$
  - 6:          $\rho = x \cos(\theta) + y \sin(\theta)$
  - 7:          $i = \text{cdm}_{\rho2idx}(\rho)$
  - 8:          $A(i, j) = A(i, j) + \Delta(x, y)$
  - 9:     **end for**
  - 10: **end for**

Rotation

## What is meaning of $\Delta(x, y)$ ?

- 1  $\Delta(x, y) = 1$  for any edge point
  - Accumulator  $A$  (with normalization) shows the **probability** of having a lines at each pair of  $(\rho, \theta)$
- 2  $\Delta(x, y) = |\vec{g}(x, y)|$ , where  $\vec{g}(x, y)$  is the gradient vector at edge point  $I_e(x, y)$ 
  - Accumulator  $A$  shows the strengthen of the **dis-continued information (edge)** along pixels on the straight line with parameter  $(\rho, \theta)$
- 3  $\Delta(x, y) = |\vec{g}(x, y)| + c$ , where  $c$  is a constant.
  - A variation from the previous

## Analytic Shape - Detection of Circles

**Assumption:** We DO NOT know where is the center  $\mathbf{a}$ , but we know radius  $r$  in advance.

### Facts

- $\mathbf{A}$  is on circle  $(\mathbf{a}, r) \Rightarrow \mathbf{a}$  is on the circle centered at  $\mathbf{A}$ , radius  $r$ . See Fig. 6
- $\mathbf{B}$  is on circle  $(\mathbf{a}, r) \Rightarrow \mathbf{a}$  is on the circle centered at  $\mathbf{B}$ , radius  $r$ . See Fig. 6
- $\mathbf{C}$  is on circle  $(\mathbf{a}, r) \Rightarrow \mathbf{a}$  is on the circle centered at  $\mathbf{C}$ , radius  $r$ . See Fig. 6
- **Center  $\mathbf{a}$  is the intersection of the three circles. See Fig. 6**

We can use the **voting-technique**, as used in line detection, to solve the detection

## Circle equation:

### Explicit form

$$(x - x_c)^2 + (y - y_c)^2 = r^2$$

- Circle: has three parameters,  $x_c$ ,  $y_c$ , and  $r$
- $\Rightarrow$  Accumulator  $A$  is an array of 3 dimensions, indexed by  $x_c$ ,  $y_c$ , and  $r$
- $\Rightarrow A$  is a function of  $x_c$ ,  $y_c$ , and  $r$

# Analytic Shape - Detection of Circles

Circle equation:

Parametric form

$$x = x_c + r \cos(\theta)$$

$$y = y_c + r \sin(\theta)$$

- $\theta$  is **not a free** parameter
- Range of  $\theta$ :  $\theta \in [0, 2\pi]$

Advantages of parametric form

Solve free parameters easily, for examples,

$$x_c = x - r \cos(\theta)$$

$$y_c = y - r \sin(\theta)$$

## Algorithm: An Informal representation

## Questions

⑦ How can we speed up the circle detection using gradient vectors at edge points?

## Questions

- ⑦ How can we speed up the circle detection using gradient vectors at edge points?

## Facts

- ① The direction of the gradient vector at every point  $(x, y)$  on a circle passes through the center of that circle.
- ② Angle  $\theta_i$  on Line 4 in Algorithm 11 and the angle of gradient vector at edge point  $I_e(x, y)$  on Line 3 must be coincided. See angle  $\theta$  in Figure 8

**Figure 8:** Circle detection: relation between gradient vectors and the center

## Using gradient vectors

- $\theta_i$  in Line 4 (Algorithm 11) is equal to the angle of the gradient vector at edge point  $(x, y)$  on the circle.
- Let  $\phi(x, y)$  be gradient angle at edge point  $(x, y)$
- Let  $\Delta\phi$  be the maximum estimation error for gradient angle.
- Range of anticipated gradient angle:  
 $R_{grad} = [\phi(x, y) - \Delta\phi, \phi(x, y) + \Delta\phi]$
- So, Line 4 in previous algorithm will be changed to

**for all  $\theta_i \in [\phi(x, y) - \Delta\phi, \phi(x, y) + \Delta\phi]$  do**

- GHT with Scaling and Rotation

## What we know

①  $\mathbf{p}$  or  $\vec{p}$ : is an edge point. Vector form of  $\mathbf{p}$  is  $\vec{p}$

$$\vec{p} = \begin{bmatrix} x \\ y \end{bmatrix}$$

②  $\theta$ : angle of gradient vector

③  $|\vec{r}|$ : radius of the circle being detected.

- $\vec{r}$  is the vector from  $\mathbf{p}$  to the center  $\mathbf{c}$  (not known now)
- We just know the magnitude of  $\vec{r}$

What is it?

Analytic Shape

Principle

Straight Lines

Circles

General Curves

Non-Analytic  
Shape

A Special Case

Generalized Hough  
Transforms (GHT)

GHT with Scaling and  
Rotation

## What we can infer

- ① Angle of  $\vec{r}$  :  $\alpha = \theta + \pi$
- ② Vector  $\vec{r}$  :

$$\begin{aligned}\vec{r} &= \begin{bmatrix} r \cos(\alpha) \\ r \sin(\alpha) \end{bmatrix} \\ &= \begin{bmatrix} r \cos(\theta + \pi) \\ r \sin(\theta + \pi) \end{bmatrix} \\ &= \begin{bmatrix} -r \cos(\theta) \\ -r \sin(\theta) \end{bmatrix}\end{aligned}$$

What is it?

### Analytic Shape

- Principle
- Straight Lines
- Circles
- General Curves

### Non-Analytic Shape

A Special Case

- Generalized Hough Transforms (GHT)
- GHT with Scaling and Rotation

Finally, the location of the center can be computed by:

$$\vec{c} = \vec{p} + \vec{r}$$

- Whenever we have  $\vec{r}$ , we know where the circle is.

## Method for detecting generalized shapes

- 1 **PHASE 1:** Describe the relationship between the gradient direction of edge points on  $S$  and a chosen point (referred to as **reference point**)  $c$  inside of  $S$ .
- 2 **PHASE 2:** Detect instances of  $S$  in the input image.

## PHASE 1: Description of $\theta \rightarrow \vec{r}$

- 1 Chose a point  $c$  inside of input shape  $S$ .
  - This point will be considered as the center of the shape, like center of a circle.
  - The purpose of **PHASE 2** is to detect  $c$
- 2 Build an loop-up table that maps  $\theta$  (angle of gradient vectors) to  $\vec{r}$ 
  - Name of this mapping: **R-TABLE**
  - One  $\theta \rightarrow$  multiple  $\vec{r}$

What is it?

Analytic Shape

**R-Table:**  $R(\theta)$  is a multivalued vector function

- Input:  $\theta$ , for example,  $\theta = \theta_i$ , See Table 1
- Output: zero or multiple vectors:  $\vec{r}_{i,1}; \vec{r}_{i,2}; \dots; \vec{r}_{i,N_i}$

**Accumulator** :  $A(x_c, y_c)$  is a **2D-array**, indexed by the coordinates of the reference point  $c$

GHT with Scaling and Rotation

## What do Scaling and Rotation affect the shape $S$ ?

### SCALING:

- Causes vector  $\vec{r}$  in R-Table scaled

### ROTATION:

- 1 Causes angle of gradient rotated an angle  $\alpha$
- 2 Causes vector  $\vec{r}$  in R-Table rotated an angle  $\alpha$

### ACCUMULATOR $A$ :

- 1 Need two more parameters: rotation angle  $\alpha$  and scaling factor  $s$
- 2  $\Rightarrow A(x_c, y_c, \alpha, s)$

### R-TABLE $R(\theta)$ :

- 1 Rebuilding is NOT required

GHT with Scaling and Rotation

## SCALING:

Scaling-matrix:

$$M_s = \begin{bmatrix} s_x & 0 \\ 0 & s_y \end{bmatrix}$$

Scaled vector  $\vec{r}^s$  of  $\vec{r}$ :

$$\vec{r}^s = M_s \times \vec{r}$$

## Scaling and Accumulator

- Perform the scaling for all vectors in R-Table.
- Increase  $A$  for each scaling factor

Transforms (GHT)

GHT with Scaling and  
Rotation

### ROTATION:

Rotation-matrix for rotation angle  $\alpha$ :

$$M_r = \begin{bmatrix} \cos(\alpha) & -\sin(\alpha) \\ \sin(\alpha) & \cos(\alpha) \end{bmatrix}$$

Rotated vector  $\vec{r}^{rot}$  of  $\vec{r}$ :

$$\vec{r}^{rot} = M_r \times \vec{r}$$

### Rotation and Accumulator

- Perform the rotation for all vectors in R-Table.
- Increase  $A$  for each rotation angle  $\alpha$ ,  $0 \rightarrow 2\pi$  in general case.

GHT with Scaling and Rotation

## Steps to rotating the whole shape $S$ by $\alpha$

- 1 All R-Table's indices are increased by  $-\alpha$ , takes **modulo** by  $2\pi$  after increasing.
  - $\theta$  : angle of gradient vector.
  - Compute  $\theta^{rot} = (\theta - \alpha) \bmod 2\pi$
  - $\equiv$  Treat R-Table as a circular buffer, shift  $\theta$  around the circular buffer an amount  $-\alpha$
- 2 All vectors found at  $\theta^r$  are rotated by  $\alpha$

---

**Algorithm 16** Detection of instances of  $S$  with scaling and rotation

---

- 1: Create a 4D-Accumulator, referred to as  $A(x_c, y_c, r, s)$
  - 2: Set 0 for all cells in the accumulator
  - 3: **for all** edge point in  $I_e(x, y)$  **do**
  - 4:     Create vector  $p = [x, -y]^T$      ▷ negative y, because  
      y-axis: upright, x-axis: to-right
  - 5:     Obtain gradient vector  $\vec{g}$  at  $I_e(x, y)$
  - 6:     Compute angle  $\theta$  of  $\vec{g}$
  - 7:     **for all** rotation angle  $\alpha$  **do**
  - 8:         Compute  $\theta^{rot} = (\theta - \alpha)$  **modulo**  $2\pi$
  - 9:         Find R-TABLE's row:  $l = \text{cdm}_{\theta^{2id_x}}(\theta^{rot})$
  - 10:        Get List  $L$  of vector  $\vec{r}$  from Row  $l$
  - 11:        Compute rotation matrix  $M_r(\alpha)$
-
